Erosion Control Permit - Pursuant to Ordinance No. 13-104

Permit #:	Permittee:	Issue Date:
Site Address:	Disturbance Area (square feet):	

Allowing dirt, mud and other material to be tracked, washed, or dumped on the street results in potential contamination of local waterways and groundwater. Erosion control and construction site runoff prevention enforcement is required by the City of Turner National Discharge Elimination System (NPDES) permit issued by the Department of Environmental Quality. Accumulations of eroded material in local waterways can result in elevated mercury levels in fish and unhealthy levels of other heavy metals in the waterway. Muddy water can bury spawning grounds and make it difficult for fish to breathe, see predators, or feed. Heavy sediments in the water can lead to increased water temperatures.

Required Conditions:

1. Permittee must comply with the City of Turner Erosion Control and Pollution Prevention Ordinance (Ordinance No. 13-104) and adhere to the approved CSPPP associated with this project.
2. Disturbance shall be confined to the project site defined in the CSPPP. The project site must be stabilized during periods of no work, including after each workday. The Erosion Control Ordinance prohibits offsite movement of 0.5 cubic feet of material.
3. If construction equipment or vehicles will be used onsite, a stabilized and adequately sized construction entrance shall be installed at all access points to prevent equipment from tracking sediment off-site.
4. Dust shall be minimized during dry weather work using appropriate control measures.
5. Adequate waste management methods shall be employed to protect the stormwater system from any exposure to solid or liquid waste generated on-site. Foreign material is prohibited from being buried onsite or stored in a manner that exposes solid and/or liquid waste to stormwater.
6. All disturbed soil not being actively worked must be stabilized within 14 days of inactivity. Permanent stabilization shall be used on all disturbed soil not being actively worked after 60 days of inactivity.
7. Permittee must inspect and maintain the control measures identified in the CSPPP, providing corrections as necessary. Inspections shall occur at least once every 4 work days AND within 24 hours of a 1/2" storm event (1/2" in 24 hours). During inactive periods, the inspection frequency may be reduced to once every 14 days.
8. The permittee is responsible for remediating the impacts of any control measure failure. Any discharge to adjacent property, right-of-way, stormwater system, or Waters of the State shall be removed at the expense of the permittee.
9. Records of inspections, corrective actions, and approved changes to the CSPPP must be maintained and kept onsite at all times.
10. Permit closure is required at the completion of the project. Prior to permit closure, all temporary control measures shall be removed, and final stabilization achieved. For sites needing final building inspections, no such inspections shall occur prior to closure of the Erosion Control permit.
